

# A PRAYER GUIDE FOR CLIMATE ACTION

**Pray for** those suffering from the impacts of climate disruption in the United States and worldwide—that God will provide and protect.

**Pray for** the rest of God's creation, which is struggling to adapt quickly enough to changing climatic patterns—that God would sustain and restore.

**Pray for** the church in North America to respond faithfully to the challenge of climate change—that God would awaken and empower.

**Pray for** our political leaders in the United States to agree on responsible climate solutions—that God would convict and unite.

**Pray for** all other key players connected to this growing problem—that God would guide and bless;

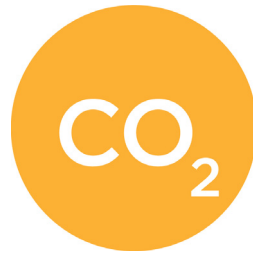

Climate impacts include extreme and erratic weather, acidifying oceans, rising sea levels, failing crops, water shortages, more severe wildfires, declining fisheries, and more.

Climate change has become the number-one threat to biodiversity today, as many species of animals and plants lose suitable habitats and face extinction.

There is still a lot of confusion and controversy in parts of the North American church around climate change, and we need help re-engaging this issue from a biblical perspective.

The U.S. is one of the biggest emitters of carbon pollution—impacting people around the world—and we also set a powerful moral, political, and economic example on the global stage.

... for the fossil fuel industry to adapt and lead instead of opposing solutions, and for the environmental movement to experience God at work in creation;

These impacts hit the poor and vulnerable the hardest. They also lead to greater resource-based conflicts, political instability, and human trafficking.

Creation brings glory to God, and we are uniquely created in God's image and given the responsibility to be good stewards of the rest of creation.

A growing number of churches, campuses, ministries, and denominations are stepping up to get involved, and we need all people to do their part, from the younger generations to the senior leaders.

We also need to invest in green jobs and new technology, adapt to climatic changes already underway, and care for those most impacted, both here and around the world.

... and for the scientific community to increase in understanding, for the media to communicate information with clarity, and for all of us to find our place in responding faithfully to this moral challenge.
